

by the QMML socitey

Christmas mini Hackathon

The time to showcase your
creativity

Instructions

Teams can use any ML model they want to solve a binary classification task. Their model has to predict if Santa is in a picture

*We encourage
creative solutions*

Hints:

CNNs, GANs, models
like ResNet or
MobileNet for
transfer learning
and fine-tuning.

How do we select the winners

Accuracy on Test dataset

Which submission can get a higher accuracy on the test dataset.

Originality

No copying from the internet or use chat-gpt. You can still look for model implementation and learn online, but do not copy paste an entire model

Side Mission

Who can generate the best Santa image from the dataset?

What does the data look like?

not-a-santa

not-a-santa

not-a-santa

santa

santa

santa

*We have given
you the code to
extract all the
data!*
