

QMML Christmas Hackathon - Submission Guidelines

Deadline: Sunday 14th December 2025 23:00 GMT

You can make submissions for either the **Accuracy** task or the **Visualisation** task or **Both**.

You will be required to **email** your submission to us. In your mail, please specify **which task** you are participating in.

ACCURACY – Expected format: csv file

Structure of CSV should be Transaction ID for each of the 2000 items in the provided test.csv dataset file, as well your **predicted** Boolean value “0” or “1” for ReturnFlag (the status of whether the item was returned or not).

Example to the right:

	TransactionID	ReturnFlag
0	8001	1
1	8002	0
2	8003	1
3	8004	1

Please send this csv file to ec22935@qmul.ac.uk by the deadline, accompanied with a message for which task you are participating in.

VISUALISATION – Expected format: Fully running ipynb file, with relevant outputs printed out.

We will assess your submission based on five categories.

Patterns discovered	Clarity of graphs	Creativity	Explanations	Technical correctness
---------------------	-------------------	------------	--------------	-----------------------

A panel of judges will assess your work and award a score out of five for each of these areas.

If you are entering ONLY the Visualisation task, and have not attempted the accuracy task, do not worry about modifying any other code cells, the starter notebook we have provided you with will run from start to finish with no issues (as long as your paths are defined correctly).

If you would like to make a submission for the visualisation task, please email your fully running notebook to ec22935@qmul.ac.uk by the deadline, accompanied with a message for which task you are participating in.

Here is a Link to the QMML GitHub: <https://github.com/Queen-Mary-Machine-Learning-Society/QMML>

This is where you can find the Starter Notebook, and Dataset files to get started. Good luck with your submissions!

Deadline: Sunday 14th December 2025 23:00 GMT
